7.5 – Triangles

Triangles are classified by the angles and their side length.

<p>Acute Triangles</p> <ul style="list-style-type: none"> All of the angles are acute. 	
<p>Right Triangles</p> <ul style="list-style-type: none"> A triangle with 1 right angle 	
<p>Obtuse Triangles</p> <ul style="list-style-type: none"> A triangle with 1 obtuse angle 	
<p>Scalene Triangles</p> <ul style="list-style-type: none"> None of the sides are the same measure. 	
<p>Isosceles Triangles</p> <ul style="list-style-type: none"> Two of the sides are congruent Two of the angles are congruent 	
<p>Equilateral Triangles</p> <ul style="list-style-type: none"> All of the sides and angles are congruent. Each angle measures 60° 	

The sum of the measures of the angles of a triangle is 180° . This means that if you know the measure of one or more angles, you can easily find the measure of the missing angle.

$180^\circ - \text{known} - \text{known} = \text{unknown}$.

Reteaching Page 7.5 – Triangles

Acute Triangle	a triangle with all angles less than 90°	Polygon	a closed plane figure made by three or more line segments
Congruent	two shapes of exactly the same size and proportions	Right Triangle	a triangle with one angle that is 90°
Equilateral Triangle	a triangle with all sides the same measure	Scalene Triangle	a triangle with no side having an equal measure
Isosceles Triangle	a triangle with 2 sides the same measure	Vertices	common endpoints that form a "corners" of a polygon
Obtuse Triangle	a triangle with one angle that is greater than 90°
